Beckert Seed and Bulb Company's Choice Lawn Mixtures

Your home deserves a lawn of smooth, velvety texture which will remain a deep emerald-green through the spring, summer and fall; a lawn that will bring out all the beauties of your shrubbery, trees, and gardens, and provide the most appropriate setting for the house itself. Such a lawn is possible only by sowing the highest quality lawn mixtures that have been carefully tested time and again to prove their dependability.

A Word About Lawn Mixtures

Lawn mixtures that weigh 24 pounds to a bushel and contain no weight-making seeds such as Timothy or White Clover, show that only the highest grade of re-cleaned, fancy grasses have been used in the formula.

Our Evergreen, Shady and Terrace Lawn Mixtures weigh 24 pounds to a bushel and contain the finest quality of fancy re-cleaned grasses.

☞ Lawn Mixtures weighing but 14 to 15 pounds to the bushel and sold at low prices, will be found to contain a large percentage of light, chaffy seeds. The number of live seeds in a bushel weighing 14 pounds will be far less than in one weighing 24 pounds.

Evergreen Lawn Mixture

Our Evergreen Lawn Mixture represents the utmost in high quality Lawn Mixtures. The different grasses used are all extra re-cleaned seeds and are selected for their value in producing a lawn of fine-leaved, dwarf growing grasses.

Carefully tested for germination and purity, this mixture cannot be surpassed for quick and lasting results. On soil which has been properly prepared, Evergreen Lawn Mixture will produce a close, vigorous, velvety turf remaining green throughout the season. One quart will sow 250 square feet; one peck, 2400 square feet; one bushel, 10,000 square feet.

Price, qt., 45c; 2 qts., 85c; 4 qts., \$1.50; pk., \$2.75; ½ bu., \$5.00; bu. (24 lbs.), \$10.00; 100 lbs., \$40.00, postage or express extra.

Shady Lawn Mixture

A carefully blended mixture of those varieties of grasses whose natural habitat is shaded places. The best lawn seed to plant under trees and on the shaded sides of walls and buildings. Makes a thick, dense lawn where other grasses will not thrive.

NOTE. Maple trees are gross feeders and large users of moisture, and their dense foliage keeps out both light and air. Particular care must be taken in fertilizing and watering to grow good grass close to the maples.

Price, qt., 50c; 2 qts., 95c; 4 qts., \$1.75; pk., \$3.25; ½ bu., \$6.25; bu. (24 lbs.), \$12.50; 100 lbs., \$45.00, postage or express extra.

How to Care for Your Lawn

Nothing will add to the appearance and, for that matter, actually enhance the value of your home to such a degree as a well-made, well-kept lawn. It makes the most appropriate setting for trees, shrubs, and flowers, and helps to make a house "home."

SOIL. The soil for a fine lawn requires a very thorough preparation as the physical composition cannot be materially changed once the lawn is established. The ideal lawn soil is well drained, well fertilized and heavy enough to hold moisture without becoming soggy.

Raw subsoil exposed in grading should be covered or replaced by at least 8 inches of good top soil. If good top soil is not available, the soil may be gradually conditioned by turning under successive cover crops.

Sandy soils should have body added to them by turning under well-rotted manure, Humus or Peat Moss.

Stiff clay soils will be benefited by the addition of sand or finely sifted ashes. Peat Moss is also excellent for breaking up clayey soils.

FERTILIZING. Thoroughly rotted barnyard manure is the best fertilizer to mix with the soil before making a lawn, but unfortunately it is very difficult to obtain. Fresh manure is invariably full of weed seeds and should not be used. Pulverized Sheep Manure is an ideal lawn fertilizer. Apply at the rate of 100 pounds per 1000 square feet and as an additional fertilizer apply Bone Meal or Vigoro, 50 pounds per 1000 square feet. Sheep Manure, Bone Meal and Vigoro are best applied after spading and raked in. If barnyard manure is used, it should be dug in.

PREPARATION. Spade or plow as deeply as soil conditions permit; then rake roughly to fill in hollow spaces, removing all rubbish, coarse lumps and stones. At this stage, particularly if much grading or filling has been necessary, allow the ground to settle for a week or ten days before the final fine raking. This will also give weed seeds, that have been brought to the surface, a chance to sprout so that they will be killed by the final raking.

CHOICE OF SEED. High grade dependable lawn mixtures will, as a rule, give better results than the separate grasses alone. B. S. & B. Co.'s Evergreen Lawn Mixture contains one variety that sprouts quickly, one variety that makes dense lateral roots, another that is deep rooting, and still another because of its ability to withstand drought. Our other mixtures, Shadyland, Terrace and Putting Green are made with

the same care and will be found to be the best in the market for their particular purposes.

SEEDING. To insure a thick, even stand, sow plenty of seed, 1 quart for each 250 square feet or an excessive quantity will do no harm. The best way to be sure of sowing seed evenly is to divide it in half and go over the plot twice, making the second sowing at right angles to the first.

COVERING THE SEED. The seeds in our lawn mixtures are very fine and should be covered lightly, in fact rolling with a medium weight roller to press the seed into the soil is the best method.

WATERING. It is often necessary in dry weather to water the lawn. This should be done in the late afternoon or evening to prevent scalding and a thorough soaking twice a week is better than nightly light sprinkling.

MOWING. Frequent mowings will help to produce a fine thick turf. Do not set the blades too close to the ground in hot weather.

ROLLING. All lawns should be rolled in the Spring to bring the roots in firm contact with the soil and to level out bumps and hollows that have appeared over Winter. An occasional rolling in the Summer is also beneficial.

FEEDING. All lawns, new and old, require a top dressing or feeding in Spring and Fall, and we know of no better fertilizer to use for this purpose than Vigoro, applied at the rate of 50 pounds per 1000 square feet. For Summer feeding use one-half the above quantity and water thoroughly after applying.

RESEEDING. Reseed lightly in the Spring and Fall, even on well established turfs. Large bare spots should be dug up, well fertilized and reseeded, while small bare spots need only be scratched deeply with a steel rake so as to make a fine seed-bed.

THE USE OF LIME. Many of the finer turf grasses grow best on a slightly acid soil, so that lime should be applied only on very acid soil, as shown by the growth of green moss, plantain or sour grass. Apply at the rate of 50 pounds per 1000 square feet.

Creeping Bent Lawn Mixture

All of us have admired and envied the soft, rug-like texture of the turf on golf putting greens. The finest of these are sown with the Bent Grasses, which have very fine blades and send out creeping root stalks, making a thick, even velvety turf.

In our experiments, in search for the best grasses for lawns, we have planted test plots of the various special grasses, both alone and in mixtures. These plots have invariably shown that the Bent varieties and mixtures of the Bents are superior to other grasses in producing a smooth, closely matted, beautiful green turf.

This special Creeping Bent Mixture contains only Seaside Bent (*Agrostis maritima*), European Bent (*Agrostis species*), and Fancy Recleaned Red Top (*Agrostis alba*). Planted on rich, heavy, acid soils where plenty of moisture can be supplied, it will produce the finest turf imaginable.

Only acid fertilizers, such as Sulphate of Ammonia, and Floranid, should be used on Bent lawns, and the use of lime entirely avoided. Sow at the rate of one pound to 300 square feet. Price, lb., \$1.50; 5 lbs., \$6.75; 10 lbs., \$12.50; 25 lbs., \$27.50; 100 lbs., \$100.00, postage or express extra.

Terrace Mixture

Terrace Mixture is, as the name implies, a special mixture for slopes and terraces. It is made up from a number of deep rooting, drought-resisting grasses, and once established makes a thick, long lasting turf.

Prices, qt., 50c; 2 qts., 90c; 4 qts., \$1.70; pk., \$3.25; ½ bu., \$6.00; bu. (24 lbs.), \$12.00; 100 lbs., \$45.00, postage or express extra.

Putting Green Mixture

Only a few of the rarer and more expensive turf grasses will meet the strict requirements of the golf putting green. We have combined these special grasses into a high grade mixture that will make a firm, close, springy turf of good color that will withstand constant tramping. State if for use on light, dry, or heavy, rich soils.

Price, lb., \$1.00; 5 lbs., \$4.50; 10 lbs., \$8.50; 25 lbs., \$20.00; 100 lbs., \$75.00, postage or express extra.

Supreme Green Lawn Mixture

A good grade Lawn Seed Mixture for general use. Especially recommended for large plantings, vacant lots, etc., where soil conditions are not of the best.

Mixed according to a special formula to give quick and lasting results. Grasses used in this mixture are thoroughly cleaned and free from weed seeds.

Price, lb., 50c; 5 lbs., \$2.25; 10 lbs., \$4.00; 25 lbs., \$8.00; 100 lbs., \$30.00, postage or express extra.

Miscellaneous Grasses

As a rule mixtures are better than separate varieties of grasses, as two or more varieties when properly blended will withstand adverse weather conditions better than a single variety. For exceptional soil conditions, it is sometimes necessary to draw up formulas.

We list below the various grasses used for lawns, hay and pastures, together with short descriptions of the uses of each. All have been specially grown, cleaned and recleaned, and are guaranteed to conform with the Pure Seed Laws of the various States.

Prices subject to market changes.

Creeping Bent, Seaside (*Agrostis stolonifera maritima*). A true Creeping Bent of remarkable purity. Makes a thick, dense turf on heavy, sour soils, and is unexcelled for fine lawns and putting greens. Our seed is the true Seaside strain, certified, sealed and harvested in Coos County, Oregon, where there are natural stands of this grass running 98 to 99 per cent pure. Lb., \$2.25; 10 lbs., \$21.00; 100 lbs., \$200.00.

Creeping Bent, European. (*Agrostis stolonifera*). Largely used for fine lawns and putting greens. Does well on wet, sour soils. Lb., \$1.60; 10 lbs., \$13.00; 100 lbs., \$118.00.

Canadian Blue Grass (*Poa compressa*). Similar to Kentucky Blue Grass, but inferior to it except for the fact that it will grow on thin, gravelly soils. Lb., 60c; 10 lbs., \$5.00; 100 lbs., \$45.00.

Crested Dog's Tail. (*Cynosurus cristatus*). A fine leaved grass that does well on hard, dry soil and in shady places. Should be used only in mixtures with other varieties. Lb., 55c; 10 lbs., \$4.75; 100 lbs., \$42.50.

Kentucky Blue Grass. (*Poa pratensis*). One of our finest lawn seeds, and also useful for hay and pasture. Particularly adapted for rich limestone soil, but will do well on any rich soil. This variety is the base of our Evergreen Lawn Mixture. Lb., 70c; 10 lbs., \$6.00; 100 lbs., \$55.00.

Orchard Grass (*Dactylis glomerata*). A hardy, quick-growing grass that gives a large yield of excellent hay, and may be cut several times during the season. Does well on a variety of soils and in lightly shaded locations. Lb., 45c; 10 lbs., \$3.50; 100 lbs., \$30.00.

Red Fescue (*Festuca Rubra*). Of particular value for sandy or gravelly soils, also does well in shade. Spreads by underground stems. Can be used alone. Lb., 65c; 10 lbs., \$5.75; 100 lbs., \$52.50.

Red Top, Fancy Recleaned (*Agrostis alba*). One of the "Bent" grasses which spread by creeping roots, but makes a rather loose turf when used alone. Especially

valuable on acid soils. Fine for lawns, meadows and pastures. We offer only fancy quality, recleaned seed. Lb., 60c; 10 lbs., \$5.00; 100 lbs., \$45.00.

Rough Stalked Meadow (*Poa Trivialis*). One of the finest grasses for shady places. Leaves flat and light green, very dwarf growing. Does best on medium soils. Lb., 75c; 10 lbs., \$6.00; 100 lbs., \$55.00.

Rye Grass, Perennial, Pacey's Imported (*Lolium perenne*). A very rapid grower and used as a nurse crop in mixtures. Excellent for quick lawns and pastures, but not long lasting. Does well on all moist soils. Lb., 40c; 10 lbs., \$3.00; 100 lbs., \$25.00.

Rye Grass, Perennial, American Grown. Similar to the above but slightly coarser growth. Use for quick effect. Lb., 35c; 10 lbs., \$2.50; 100 lbs., \$20.00.

Rye Grass, Italian (*Lolium Italicum*). Similar to Perennial Rye Grass, but of somewhat quicker and coarser growth. Lb., 35c; 10 lbs., \$2.75; 100 lbs., \$22.00.

Sheep's Fescue (*Festuca ovina*). Similar to Red Fescue, but leaves are very narrow and wiry. Does well on poor soil and should only be planted in mixtures, as when planted alone it inclines to tuft or bunch. Lb., 60c; 10 lbs., \$5.00; 100 lbs., \$45.00.

Timothy (*Phleum pratense*). The most widely grown and profitable hay grass. Its nutritive value is increased by sowing one of the clovers or Red Top with it. If sown alone, 15 pounds per acre. Write for prices.

White Dutch Clover. Our grass seed mixtures do not contain White Dutch Clover, as it does not mix well with grass seeds, which are lighter in weight. However, White Dutch Clover has a definite place in lawns, as it produces a quick sod and helps to feed the other grasses. Unless a very heavy seeding is required, as for poor soils, 1 lb. per 2000 square feet is sufficient. ¼ lb., 25c; ½ lb., 45c; 1 lb., 75c; 5 lbs., \$3.50.

For Hay and Pasture Mixtures see page 79.

The Full Market Basket

Fresh From Your Own Garden

There is all the difference in the world between vegetables fresh from your own garden and fresh from other sources. Fresh in some cases may mean a week and even from the farmer markets means at least a day old.

It has long been known that the food value of fresh vegetables decreases steadily from the time they are picked until they are cooked, so that in order to enjoy their complete tastiness and get the full benefit of their health-giving properties, you must grow your own. And "growing your own" is not all hard work, for there is a lot of pleasure in watching the various plants develop, in harvesting and finally in eating the fruits of your labor.

Soil. Rich acres are not necessary in order to have these delicacies from your own garden. Any soil that can rightfully be called soil can be made to grow the finest vegetables. The ideal soil is sandy loam, rich in humus (decayed vegetable matter) and well drained. Heavy soils are greatly improved by an application of lime, and light soils by digging in cover crops (such as cow peas, rye, etc.), or large quantities of strawy manure.

Pulverized sheep manure is an excellent all-around fertilizer for gardens. It is high in available plant food, contains humus, and is absolutely free from weed seeds. Dig in at the rate of five pounds to fifty square feet. For root crops (beets, carrots, etc.), put a little bone meal in the drill and cover lightly with soil before sowing seeds. For leaf crops (cabbage, lettuce, etc.), use a small quantity of nitrate of soda from time to time during the growing season. This quickens the growth and produces larger plants.

Preparation. Prepare the ground as early in the Spring as it will crumble on the spade

or fork. If top soil is deep, spade to a depth of 8 to 10 inches; if shallow, dig all the top and just a little of the bottom soil and mix thoroughly. After spading, break up the lumps with a steel rake and make your garden as level as possible. Then mark out your rows.

Planting Dates. Due to changing weather conditions and differences in localities, we cannot give definite dates to plant. As a general rule, however, all the hardy vegetables (beets, carrots, lettuce, smooth peas, etc.), may be planted outdoors as soon as the ground can be worked; tender varieties (corn cucumbers, wrinkled peas, etc.), about when the maple trees start to leaf.

Thin Out. We would venture to state that more gardens are spoiled by lack of proper thinning out than from any other cause. Thin out as soon as the plants are big enough to handle (see cultural instructions preceding each variety for distances). Plants thinned out need not be wasted, for the majority of vegetables transplant very easily and even if they must be thrown away, it is better to have a dozen good plants that will yield than fifty poor ones that will not.

Cultivation. This takes you up to the cultivation and watering of your garden. Cultivate frequently, not only to keep down weeds but to conserve moisture. Water only during extreme droughts and be sure to thoroughly soak the ground.

Do not permit any ground to remain idle after taking off an early crop. Plant something immediately, if only a cover crop to turn under.

Full cultural directions are given throughout the catalog immediately preceding each variety. We will be glad to furnish additional instructions on request.

B. S. & B. Co's. Quality Vegetable Seeds

The varieties of Vegetables listed on the following pages are our personal selections, backed by years of experience in supplying quality seeds to the private and professional gardener.

Our list of varieties will be found to include such newer varieties as have proven their worth as well as the recognized standard sorts.

This extensive list gives ample opportunity for you to select the varieties best suited to your particular needs and climatic conditions, which is not the case when your selection is limited to a few varieties.

Vegetable Specialties for 1931

Cucumber, Early Russian

From Seed to Table in 50 Days.

The earliest and most productive Cucumber that we have ever had the pleasure of offering to our customers. Fruits are medium small in size, seldom more than 4 inches long by 2 inches thick, with very small seed cavity. Quality and flavor are unsurpassed. Vines are not so long as other varieties and are extremely productive.

Plant part of your Cucumbers this year with Early Russian, use the first fruits for slicing until the larger varieties are ready and then use the balance for pickles. Pkt., 10c; oz., 25c; $\frac{1}{4}$ lb., 75c.

Bean

Asgrow Valentine

For years the Black Valentine has been recognized as one of the finest flavored Beans in existence. Its one drawback has been "strings," but now after years of patient work our growers have developed a strain that is absolutely stringless. Pods are long, straight, absolutely stringless, and of excellent flavor. Pkt., 20c; $\frac{1}{2}$ pt., 40c; pt., 75c; qt., \$1.25.

Pea

Dwarf Telephone

You need no longer bother with stakes for your late crop Peas, as this fine variety is the dwarf edition of that old stand-by, Improved Telephone. Vines are scarcely two feet high, very prolific, with long well filled pods. Pkt., 10c; pt., 30c; qt., 60c; 2 qts., \$1.10; 4 qts., \$2.00; bu., \$12.00.

Squash

True Italian Green Striped

Three Vegetables in One

Boiled or baked, this variety is one of the sweetest, finest grained and most delicious of the Squashes. Picked when about 4 inches long it makes an excellent substitute for Asparagus; sliced and fried it is even superior to Eggplant in quality and flavor.

Vines are more bushy than vining. Fruits are dark and light green mottled and when full grown 15 to 16 inches long by 4 to 5 inches in diameter. Pkt., 10c; oz., 25c; $\frac{1}{4}$ lb., 80c.

Cabbage

Hollander Resistant

For Yellows infected Soil.

The best method of fighting plant diseases is to plant disease resistant strains whenever they are available. In the mid-west where Cabbage Yellows is the cause of most crop failures, Hollander Resistant produces amazing crops in spite of adverse weather conditions. Heads are medium large, almost round, solid and of superior quality. Pkt., 25c; $\frac{1}{2}$ oz., 60c; oz., \$1.00.

Asparagus Seed

(SPARGEL)

An Asparagus bed can be started either from seed or roots. Sow seed early in the Spring, $\frac{3}{4}$ inch deep, in rows $1\frac{1}{2}$ feet apart; thin out the plants to 6 inches apart. Transplant following season as given under roots.

One ounce of seed will sow 50 feet of row.

Giant Argenteuil. Purple tinted stalks. Pkt., 10c; oz., 20c; $\frac{1}{4}$ lb., 50c.

Palmetto. Large green stalks. Pkt., 10c; oz., 20c; $\frac{1}{4}$ lb., 50c.

Washington Rustproof. A new rust-resisting, heavy-producing Asparagus from the U. S. Department of Agriculture. Of rapid growth, large size, and very tender. Pkt., 10c; oz., 25c; $\frac{1}{4}$ lb., 75c.

Asparagus Roots

An Asparagus bed is permanent, so that much care should be taken with its preparation. The bed should be on well drained ground, heavily manured and spaded $1\frac{1}{2}$ to 2 feet deep. Place roots in trenches 1 to $1\frac{1}{2}$ feet deep and cover with 3 inches of soil. As the shoots come up, pull in soil from the sides from time to time until the bed is level.

No Asparagus should be picked until the third year and then only sparingly. The bed should not be cut over after the first week in July, as the roots must have some time to store up strength for the following year. Top-dress each Fall with manure, which should be dug in early the next Spring.

Palmetto and Giant Argenteuil. 2-yr. roots. Bundle of 50, \$1.25; \$2.00 per 100; \$12.50 per 1000.

Washington Rustproof. 2-yr. roots. Bundle of 50, \$1.75; \$3.00 per 100; \$20.00 per 1000.

If wanted by parcel post, add 10c per 100.

Washington Asparagus.

Brussels Sprouts.

Artichoke (ARTISCHOKÉ)

One of the vegetable aristocrats and well worth growing if you care for something "different." Edible portion is the large, thistle-like head. If started indoors very early will bear first year. Same culture as for cabbage, and as Artichokes are perennial, plant where they need not be disturbed.

LARGE GREEN GLOBE. The standard variety. Pkt., 25c; $\frac{1}{2}$ oz., 40c; oz., 75c.

Broccoli (SPARGEL-KOHL)

Quite similar to cauliflower but will produce fine heads in localities where cauliflower cannot be successfully grown. Same culture as cabbage.

Early Green Sprouting Improved

A most delicious new variety, bearing loosely arranged heads, somewhat similar to cauliflower. Both flower heads and stalks of heads are edible, having a distinctive flavor. Flower heads are light green in color and ready for the table 60 days from time of sowing. Pkt., 25c; $\frac{1}{2}$ oz., 60c; oz., \$1.00.

Brussels Sprouts

(ROSEN-KOHL)

A delicious and easily grown Fall vegetable, and one of the few that may be enjoyed in late Fall after frost has killed the less hardy kinds. Produces miniature cabbage heads at the base of each leaf. Use same cultural directions as for late cabbage, and when the sprouts commence to form, break off the lower leaves.

Long Island Half Dwarf. Covered with tender sprouts of good flavor. Pkt., 10c; $\frac{1}{2}$ oz., 20c; oz., 35c; $\frac{1}{4}$ lb., \$1.10.

GARDEN and MANGEL BEETS

Crosby's Egyptian Beet.

GARDEN BEETS

(*Roten Rube*)

Beets are easily the favorite of all root crops. Best results are obtained in well drained, loamy soil, although any soil will do if it is deeply dug and cultivated frequently. Sow as early as the ground can be prepared, in rows 1½ feet apart, 1 inch deep, pressing the soil down firmly over the seed. When large enough to use as Beet greens, thin out to 2 inches apart.

A continuous supply can be had throughout the season by sowing seeds every two weeks up to early August. Make a liberal planting in July to provide roots for Winter use.

One ounce of seed will sow 50 feet of drill.

Extra Early Egyptian. Fine for first early crop and for forcing. Roots dark red and decidedly flat; flesh sweet and tender. Pkt., 10c; oz., 20c; ¼ lb., 50c.

CROSBY'S EGYPTIAN, SPECIAL STRAIN. No finer strain is grown than the stock we offer of this largely used Beet. It is of rapid growth, with small tops, the roots taking on their deep turnip shape at an early stage; flesh blood-red and of fine quality. Pkt., 10c; oz., 20c; ¼ lb., 50c.

EARLY WONDER SPECIAL. A handsome early Beet of deeper turnip shape than Crosby's Egyptian. Recommended for both market and home gardens. Flesh blood-red, tender and of good flavor. Pkt., 10c; oz., 20c; ¼ lb., 60c.

Detroit Dark Red. An ideal main crop Beet, universally planted. Large, globe-shaped roots, sweet, fine grained, and dark red in color. Pkt., 10c; oz., 20c; ¼ lb., 50c.

Sugar Beets

A little higher in food value than Mangel Beets, but the yield per acre is not so large. Require same culture as Mangel Beets.

Giant Half-Sugar. Oz., 10c; ¼ lb., 25c; lb., 75c.

Klein Wanzleben. Oz., 10c; ¼ lb., 25c; lb., 75c.

Mangel or Stock Beets

(*Mangel Wurzel*)

Excellent food for cattle or chickens during the Winter when other green food is not available. Sow in May or June, in rows 1½ feet apart, 5 to 6 pounds of seed per acre. Thin to stand 12 to 15 inches apart and cultivate frequently.

Golden Tankard. An enormous yielder; flesh and skin deep yellow. Oz., 10c; ¼ lb., 25c; lb., 75c.

Giant Sludstrup. Reddish yellow, long oval shape. Food value higher than any other Mangel. Oz., 10c; ¼ lb., 25c; lb., 75c.

MAMMOTH LONG RED. Grows to an immense size, roots often weighing to 35 pounds. Oz., 10c; ¼ lb., 25c; lb., 75c.

Red Eckendorfer. Similar to Mammoth Long Red, excellent quality. Oz., 10c; ¼ lb., 25c; lb., 75c.

Lucullus Swiss Chard.

SWISS CHARD

(*Spinach Beet*)

A most satisfactory vegetable for the small garden. A short row is sufficient to supply greens all Summer, and if not cut too close, additional leaves will come up from the roots. Use same culture as for beets and for best results thin out to at least 4 inches between plants.

One ounce of seed will sow 50 feet of drill.

GIANT LUCULLUS. Large, dark green, thickly crumpled leaves with white midrib which may be used the same as asparagus. Pkt., 10c; oz., 20c; ¼ lb., 50c.

GREEN LYON. A handsome dark green Swiss Chard with smoother leaves than Lucullus. Pkt., 10c; oz., 20c; ¼ lb., 50c.

BEANS—DWARF or BUSH (BOHNEN)

Giant Stringless Green Pod Beans.

Grow Bush Beans in your garden and get more meals per square foot. They are easy to grow, thrive in almost any soil, and produce big crops in little space.

The seed should not be sown until danger from frost is past. Sow in rows $1\frac{1}{2}$ to 2 feet apart, dropping the seeds 4 inches apart, and covering 2 inches deep. Cultivate frequently and do not work around the plants while they are wet, lest they "rust." Pick the pods before they are fully developed and the plants will produce several good pickings.

For a continuous supply, make successive sowings every two weeks up to mid-July. Plenty of pulverized sheep manure and watering in the dry spells will greatly increase the yield. Apply water to the soil between the rows, not to the foliage.

One quart of Beans will plant 100 ft. of row.

If wanted by parcel post, add 8c per pt., 10c per qt.

Green-podded Bush Beans

ASGROW VALENTINE. A pure bred stringless strain of Black Valentine. Just as hardy, just as prolific, just as fine flavored, but without the strings. See Novelties page 5. Pkt., 20c; pt., 75c; qt., \$1.25.

Black Valentine. Pkt., 10c; pt., 40c; qt., 75c; 2 qts., \$1.40; 4 qts., \$2.50; bu., \$13.00.

SELECTED CABBAGE (KRAUT).

Early Jersey Wakefield Cabbage.

To grow good Cabbage, a fairly rich soil and plenty of moisture are required. Apply an abundance of manure or other fertilizer high in humus and nitrogen.

For early crop, start the seed in a hotbed or seed-flat indoors in January or February, transplanting to another bed or flat when the second pair of leaves appear; harden the plants off and set them out in the garden as soon as frosts are past. For second-early crop, sow in March or April and set out in May; for late crop, sow in May and transplant in July. Set Cabbage in rows $2\frac{1}{2}$ to 3 feet apart and space the plants $1\frac{1}{2}$ to 2 feet in the rows. Cultivate frequently and make several applications of nitrate of soda during the growing season. Insecticide soaps and Slug Shot are good remedies for Cabbage pests.

One ounce of seed will produce 3000 plants.

For late Celery, sow in March or April and transplant to trenches in late June or July. As the plants attain full size, gradually draw up earth on both sides to blanch them and bring out the flavor. Use Bordeaux Mixture as a rust preventative.

One ounce of seed will produce 5000 plants.

Mulching Paper

Mulching paper is the latest aid to gardening. By its use much of the labor of weeding and hoeing is eliminated and stronger and more vigorous growth is promoted. See page 77.

Sugar or Sweet Corn (MAIS)

Barden's Wonder Bantam Corn—A Giant Golden Bantam and Just as Sweet.

Sweet Corn is a favorite crop in most American gardens, and one of the easiest to grow. A deeply dug, moderately rich, well drained soil will give best results. Wait until soil and weather are warm before sowing; the middle of May is generally safe for the yellow varieties and two weeks later for the whites.

Whipple's Early Yellow Sweet Corn.

Sow in rows $2\frac{1}{2}$ to 3 feet apart; scatter seeds 3 to 4 inches apart and cover 2 inches deep, later thinning out to 1 foot apart in the rows. Corn is also grown in hills 3 feet apart each way for horse cultivation, leaving three strong plants in each hill. Frequent shallow cultivation is important—more necessary with Corn, perhaps, than with any other garden crop.

For succession, make sowings every 10 days up to July 15. To insure good pollination and well filled ears, grow Corn in several short rows, side by side, rather than in one long row.

One quart of seed will plant 200 hills.

If wanted by parcel post, add 8c per pt., 10c per qt.

HEALTHFUL LETTUCE (SALAT)

Dig the soil deeply for Lettuce, using plenty of manure or nitrogenous fertilizer, and adding sand or humus if the soil is heavy. For a very early crop, start seed indoors or in a hotbed in early March, thinning or transplanting the seedlings as soon as they are large enough to handle; harden them off and set them out in the garden in early April.

The first sowing outdoors may be made as soon as the ground is fit. Make the rows 15 to 18 inches apart and thin the plants out as they develop, so that they eventually stand 10 to 12 inches apart. Timely thinning and plenty of room is especially important in growing Head Lettuce. For the first crops grow Loose-Leaf or Early Butterhead varieties; follow these with the late Butterheads; and for hot weather use, grow the Crisphead or Cos types.

GARDEN PEAS (ERBSEN)

Laxtonian Peas.

There are two classes of Peas, the smooth-seeded kinds, which are very hardy and may be planted as early in the Spring as the ground can be prepared, and the wrinkled Peas, which are less hardy but much better in quality. Wrinkled Peas should not be sown much before mid-April.

Sow in drills about 3 feet apart and 3 inches deep. Tall-growing kinds may be grown in double rows, allowing 6 inches of space between in which to place brush or trellis to support the vines. All Peas do best on a fairly heavy soil which holds plenty of moisture, although the dwarf kinds will give good results on a light soil, providing it is moderately rich.

By planting one or two varieties of smooth-seeded Peas as early as possible and then a selection of wrinkled sorts that will mature in succession, a constant supply of tender green Peas may be had. Varieties are listed in the order in which they mature.

One Quart of Peas will sow 100 feet of row.

If wanted by parcel post, add 8c per pt.; 10c per qt.

CERTIFIED SEED POTATOES

We offer only **Certified Northern Grown** seed potatoes. All our stocks are grown especially for seed purposes, under the most exacting, scientific culture, and packed in standard sacks of 150 lbs., or 2½ bushels. We are glad to supply any quantity from a single peck to carlots.

CULTURE. Potatoes will grow in any well drained soil, largest crops are, however, obtained on the lighter loams. Plant the early varieties 4 inches deep, as soon as the ground can be worked in the spring; late or main crop 6 to 8 inches deep the first to the middle of June. Cultivate as soon as the plants make their appearance and keep the ground well worked at all times.

SPRAYING. Pyrox (Bordeaux Arsenate) is the best all around spray for potatoes, it not only keeps the disease in check but is also very effective against the potato bug.

POTATO SCAB. It is more effectively controlled by treating the seed with Semesan than any other preparation we have tried. See page 86.

The market is variable. Please write for prices, stating quantity required, and we will quote best prices by return mail.

Plant 10 to 12 bushels to the acre.

Early Ohio. Tubers almost round and large for an early potato. Skin is pink and fine grained; white flesh.

Early Manistee. Extra early and especially productive on heavy soils. Tubers large, oblong in shape, with rounded ends; skin pinkish with shallow eyes.

Irish Cobbler. Tubers nearly round, of good size, with creamy brown skin and white flesh. Unexcelled for baking.

Carman No. 3. A heavy producing, main crop Potato, largely grown for market. Large, round tubers with light brown skin and few shallow eyes. Does well on all soils.

Sir Walter Raleigh. Similar to Carman No. 3. Not as productive but better quality.

Green Mountain. The leading late variety. Tubers extra large, broad and oblong, with light russet skin. Immensely productive and of exceptionally high quality.

Dibble's Russet. Late or main crop; disease resistant and heavy yielder. Flesh pure white; skin rough russet appearance.

Irish Cobbler Potatoes.

PARSLEY (Petersilie)

Sow in early Spring in rows 1 foot apart and cover firmly $\frac{1}{4}$ inch deep; thin out to 6 inches. The seed is slow and irregular in sprouting and may be hastened by soaking it in warm water several hours before sowing. We suggest planting a few quick-growing seeds, (such as radishes) with Parsley to mark the row. Plants may be potted and taken indoors for Winter use.

One ounce of seed will sow 200 feet of drill.

CHAMFION MOSS CURLED. Crimped and curled leaves, rich dark green. Vigorous. Pkt., 10c; oz., 20c; $\frac{1}{4}$ lb., 45c.

Dwarf Extra Curled. Compact in growth, with beautiful, densely curled leaves, bright emerald green. Pkt., 10c; oz., 20c; $\frac{1}{4}$ lb., 45c.

Plain-Leaved. Taller and more strongly flavored than the curled sorts. Pkt., 10c; oz., 20c; $\frac{1}{4}$ lb., 45c.

Hamburg Parsnip-Rooted. Grown for its roots which are shaped like short, broad parsnips and are used for flavoring. Pkt., 10c; oz., 20c; $\frac{1}{4}$ lb., 45c.

PARSNIPS (Pastinake)

Parsnips require a deeply dug but not necessarily rich soil. The largest and smoothest roots are grown in light, mellow soil, free from stones. Fresh manure causes rough and mis-shapen roots.

The seed should be sown as early as the ground is fit—never later than mid-May. Make the rows $1\frac{1}{2}$ feet apart and cover the seed about $\frac{1}{2}$ inch deep. Thin out the plants to stand 4 to 5 inches apart. Give frequent deep cultivation. The flavor of Parsnips is improved by frost. Dig them in late Fall or leave them in the ground to be dug as needed during Winter.

One ounce of seed will sow 100 feet of row.

Hollow Crown. Long, smooth, white roots of excellent table quality. Pkt., 10c; oz., 20c; $\frac{1}{4}$ lb., 45c.

Lisbonais. Similar to Hollow Crown but white and smooth skinned. Fine quality. Pkt., 10c; oz., 20c; $\frac{1}{4}$ lb., 45c.

GERMINATING PARSLEY SEED

In our trials we find that Parsley seed covered with mulching paper immediately after sowing germinates in a week or ten days. Without mulching paper it requires about three weeks.

Champion Moss Curled Parsley.

RHUBARB (Rhabarber)

Sow in early Spring in rows $1\frac{1}{2}$ feet apart, covering an inch deep. Thin out to 6 inches. In the Fall, transplant to deep, rich soil, spacing the plants 3 to 5 feet apart each way, and mulch well with manure.

One ounce of seed will sow 150 feet of drill.

Victoria. The most popular variety. Large, tender, juicy stalks. Pkt., 10c; oz., 25c; $\frac{1}{4}$ lb., 80c.

RHUBARB ROOTS

The quickest way to have Rhubarb is to plant clumps. If large clumps are planted, some stalks may be pulled the first year. Plant roots 3 to 5 feet apart in well manured ground, cultivate frequently and cut off seed stalks as soon as they appear. After the ground is frozen, mulch with strawy manure.

Our roots are strictly first quality from transplanted seedlings, all new roots and not the old woody clumps so often offered.

Strong Roots. 15c each; \$1.50 per doz.

Clumps. 25c each; \$2.75 per doz.

Extra Large Clumps. 50c each; \$5.00 per doz.

PEPPER (Pfeffer)

Light, warm, mellow soil is best for Peppers. The seed should be started indoors or in the hotbed early in March. Give the young plants plenty of heat and moisture, transplanting to paper pots when 3 inches high, and setting them out in the garden late in May.

One ounce of seed will produce 1000 plants.

Three Weeks Forcing Radishes.

CRISP TENDER RADISHES (RETTIG)

Crispy freshness is more essential to the good tasting qualities of the Radish than to any other vegetable root and the freshest roots are, of course, those pulled from your own garden.

The three prime essentials for growing crisp Radishes are **seed, soil and temperature.**

SEED. All our seed is raised from transplanted roots, which have been carefully selected for size, form and texture. After harvest the seed is carefully threshed, cleaned and run over sieves to remove the small seeds.

SOIL. A light, sandy soil is best for Radishes, but they will do well in clay soil that has been loosened by the addition of finely sifted ashes. Avoid the use of fresh manure.

TEMPERATURE. Radishes grow best in temperatures under 70 degrees and even the Summer varieties should be sown so that they will not mature during the extreme heat of July and early August, else they will be so hot as to be unpalatable.

SOW SEED thinly not more than one inch deep in drills from 12 to 15 inches apart and thin out to stand 2 or more inches apart, according to variety. **An ounce of seed will sow 100 feet of row.**

HEALTHFUL SPINACH (SPINAT)

Green Gold Spinach.

Spinach is one of the most healthful and at same time one of the most easily grown vegetables and by judicious planning and planting may be had fresh from your own garden in all but the Winter months. While true Spinach is primarily a cool weather crop, some varieties have been developed that stand up well in hot weather, and the New Zealand Spinach (*Tetragonia expansa*) actually grows best in the hot, dry months.

Make the first sowing as early in the Spring as the ground can be prepared, in shallow drills 15 to 18 inches apart. For Fall use, sow in August and September. Late sowings, protected with straw, will provide Spinach in Winter and early Spring.

One ounce of seed will sow 100 feet of drill.

TOMATOES (LIEBESAPFEL)

Beauty Tomatoes.

Sow the seed in late February or early March, in the hotbed or a box indoors placed in a sunny window. When the plants are 2 to 3 inches high, transplant them to other boxes or paper pots, and transplant again, if possible, when about 6 inches high, to make them stocky and stimulate root growth. Set the plants in the garden, 3 to 4 feet apart in late May. A rich, moist, loamy soil is best for Tomatoes. An occasional application of nitrate of soda will push the young plants along rapidly. Sow three or four different varieties in order to have a succession of fruit all Summer. Supporting the plants with stakes or trellis will increase the yield.

One ounce of seed will produce about 2000 plants.

YOUR FLOWER GARDEN

There are two big classes of flowers: **Annuals** which bloom the same season seeds are planted and **Biennials** and **Perennials**, which for the most part do not bloom until the following year after sowing seeds. (Biennials bloom the second season and then die; Perennials continue to bloom each year for an indefinite period).

Perennials, as a whole, have a longer blooming period but there are so many places where the annuals fit in and fill out that their importance in the general garden scheme cannot be overlooked. Therefore the well balanced garden will have a border of perennials, possibly interspersed with annuals, to fill out during the Summer months, one or more beds of annuals for mass effect and in a less conspicuous place a bed of annual flowers for cutting purposes. We give below a comparison of annuals and perennials which will aid you in making your selection.

ANNUALS

- 1 Bloom in a short time from sowing.
- 2 Annuals must be planted yearly.
- 3 Period of bloom possible from annuals is roughly five months.
- 4 Most varieties of annuals bloom over a period of from 6 to 8 weeks.
- 5 Annuals give their best display from July 15th until frost.
- 6 Annual seeds are usually low priced but must be bought yearly.
- 7 Annuals are very free blooming and when picked usually send out new flowering spikes.
- 8 Many annuals are quite fragrant.
- 9 The range of colors is very large, even in the same species.
- 10 For giving quick effect, annuals are unsurpassed.

PERENNIALS

- 1 Bloom second year from sowing.
- 2 Perennials come up each year.
- 3 Period of bloom possible from perennials, including bulbous plants is nine months.
- 4 The blooming period of most of the individual perennials is short, usually 2 to 3 weeks.
- 5 May and June see the perennials at their best with another display in late Fall even after frost.
- 6 Perennial seeds are more expensive than the annuals, but need only be bought once.
- 7 Perennials are not so free blooming as annuals and with few exceptions, do not send out another crop when picked.
- 8 Few of the popular perennials are fragrant.
- 9 The range of colors is limited, especially in the same species.
- 10 Perennials will not give a quick effect, but are of a permanent nature.

TIME TO SOW. Sow hardy annuals outdoors as soon as the ground can be worked. The tender annuals can be started indoors in March or April or outdoors after danger from frost is past. Biennials and Perennials, which do not bloom the first season, are generally sown in a seed bed in June, July or August, and transplanted in late Summer to the places where they are to bloom the following season. Perennials which bloom the first season should be sown in a box indoors in February or March, and transplanted to the garden late in May.

SOIL AND PREPARATION. Flowers can be successfully grown in practically all soils. Some good fertilizer, such as Vigoro, Pulverized Sheep Manure, or Bone Meal should be dug in and thoroughly mixed with the soil when it is prepared for planting. The surface should be made as fine and level as possible.

PLANTING. The first thing to remember in planting flower seeds is not to plant them too deeply. The very fine seeds such as Petunia, Snapdragon, etc., should be scattered on the surface and pressed into the soil with a flat board. Sow larger seeds in shallow drills.

TRANSPLANTING AND THINNING OUT. With but a few exceptions, notably Poppies, young flower plants may readily be transplanted, so that they may be started in a hotbed or cold frame, or even in boxes in a sunny window, for later transplanting to the place where plants are to bloom.

As soon as the seedlings are large enough to handle they should be transplanted or thinned out to prevent overcrowding. Set plants slightly deeper than they were before lifting and be sure to firm the soil around the roots. A good rule for spacing plants in the garden is to set them apart half their full grown height.

Explanation of Symbols

Immediately following the names of the different flowers will be found the letters AH, PH, etc. These are to be interpreted as follows:

- AH.** Annual hardy. Sow seed outdoors as soon as ground can be worked.
AHH. Annual half hardy. Sow early indoors or outdoors after May first.
BH. Biennial hardy. Requires very little Winter protection.
BHH. Biennial half hardy. Best to winter in a cold frame.
BT. Biennial tender. For greenhouse use.
PH. Perennial hardy. Requires very little winter protection.
PHH. Perennial half hardy. Best to winter in a cold frame.
PT. Perennial tender. For greenhouse use.

Flower Specialties for 1931

Chinese Forget-Me-Not.

Godetia, Azalea-Flowered.

Chinese Forget-Me-Not

1285

The true Forget-me-not (*Myosotis*) is somewhat particular as to location but this charming Chinese species will grow almost anywhere. Plants grow about 18 inches tall and are covered from early Summer until Fall with bright blue, Forget-me-not-like flowers. Plants are bushy and flowers are borne on stems sufficiently long for cutting. Pkt., 15c; $\frac{1}{4}$ oz., 50c.

Kochia

1970 Childsi

An ideal Summer hedge plant. Can be used temporarily in place of privet or barberry, and also for separating the vegetable and flower gardens. Plants grow about 2 feet tall, are very bushy and uniformly long globe-shaped with fine, bright green, fernlike foliage, which turns red at the approach of Fall weather. Pkt., 10c; $\frac{1}{4}$ oz., 25c.

Kochia *Trichophylla* Childsi.

Ageratum.

Ageratum

578 Fraseri

A beautiful shade of deep amethyst-blue. Plants are dwarf, compact and very free flowering. Pkt., 25c.

Godetia

1785 Carmine

Most popular now as a florist's pot plant but is adaptable for outdoor use as a bedding plant. Plants are 12 to 15 inches high and when in full bloom the foliage can scarcely be seen for flowers. Flowers resemble those of the azaleas and are a beautiful shade of carmine. Start seed indoors in March or sow outdoors in early May. Pkt., 25c.

Amaranthus

635 Sunrise

For adding a touch of color here and there nothing can equal the flame colored foliage of this fine Amaranthus. Plants grow about 2½ feet tall with broad, flame colored leaves from top to bottom. May be started early indoors or planted out-of-doors as soon as the ground can be worked as it is quite hardy. Pkt., 15c; $\frac{1}{4}$ oz., 75c.

Amaranthus, Sunrise.

B. S. & B. Co's Supreme Asters

Aster,
American
Beauty.

Aster,
California
Giant.

Many flower lovers omit Asters from their gardens, under the impression that they are difficult to grow, but during the past Summer we have seen them growing side by side under what appeared to be the worst possible conditions with such hardy care-free flowers as Calliopsis, Poppies and Bachelor Buttons; there was even one lot interspersed, with a most brilliant effect, in a shrubby border.

Culture. Plant Aster seed indoors or in a hotbed in March for early blooms. When plants are 2 to 3 inches high, thin out or transplant to stand 4 inches apart each way or into 2½-inch pots. When 6 inches high, plants should be set in their permanent position, never closer than 12 inches apart.

Excellent results are also obtained by sowing seed where plants are to bloom. We have found that in many instances Aster-wilt and the yellows are less prevalent on plants raised in this manner. Sow seed in same manner as other annuals in a fine seed bed and do not cover too deeply. When large enough, thin out or transplant as given above.

Aster Diseases. Damping-off and Aster-wilt may be prevented by treating the seeds with Semesan before planting, or the roots may be dipped in a normal solution of liquid Semesan when transplanting. See page 86 for Semesan.

The Aster Beetle has not been so bad the past few years, but is easily kept in control by the use of an arsenical spray.

PEAT MOSS

Peat Moss is the best material for mixing with soil for starting seedlings, and also to help loosen heavy clay soils that have a tendency to bake. See page 77.

Wild Garden Mixture

We have had so many calls for something in flowers that could just be scattered and raked in odd spaces to give a wild-flower garden effect that we have made up a tall and dwarf mixture especially for this purpose. These mixtures contain a large assortment of the various annual flowers that will grow and bloom with little or no care. If possible, the ground should be spaded, the seed scattered and raked in; good results are, however, obtained by scratching the soil as deeply as possible with a steel rake and then scattering the seeds.

Pansies—Universal Favorites.

Pansies BH

Cool weather and moist soil produce the largest and finest Pansies. The best time to sow is during July or August, in shaded frames, in which the plants, given some protection, may be carried over winter and set out early the following Spring when they will commence to bloom at once and continue all Summer if watered plentifully. Next best is to sow indoors or in the hotbed in February or March.

Seed sown in May will give blooming plants in the fall. Space Pansy plants at least a foot apart and keep the faded flowers picked.

Hardy Flower Seeds may be sown out-of-doors in the open ground, in this locality, any time from about May 1st until August 15th, and transplanted to their permanent location in the late Summer or Fall. During the extremely hot days of July and August the seedlings (whether transplanted or not) should be shaded from the direct rays of the sun. Light frames covered with cheese cloth or lath spaced one half inch apart may be used for shade or even branches with a few leaves on.

Petunias For All AHH

Petunias, in the fine strains available today, are one of our finest Summer flowers. For bedding they are unsurpassed, and are almost indispensable for porch and window boxes.

Petunias, even the Giant Flowered varieties, are one of the easiest and most satisfactory flowers to grow. Give them a good start and they will bloom profusely from early Summer until late Fall.

CULTURE. The Giant varieties are best started indoors in February or March, and transplanted in May to the place where they are to bloom, while the Bedding sorts will give excellent results if sown in the open in April or May.

Petunia seeds are very fine and should be sown in very shallow drills. The best method is to sow on top of the soil, press down firmly with a smooth board, water, and then cover with cheesecloth or paper until the seedlings show. Keep well watered at all times, and transplant as soon as large enough to handle.

Sweet Peas AN

It is not difficult to grow fine Sweet Peas, even in our trying climate. The secret of success lies in getting an early start and, by thorough soil preparation, insuring a strong deep root-growth to keep the plants well supplied with water. If you want to grow the largest and finest blossoms, start as early in the spring as the soil can be worked—early in March, if possible.

Choose an open location and dig a trench $1\frac{1}{2}$ feet deep and a foot wide. Mix with the soil a liberal quantity of fertilizer (sheep manure with a little bonemeal is an excellent combination). Refill the trench with this mixture to within 6 inches of the top. Scatter the seed about an inch apart on this layer and cover them with 2 inches of soil. When the plants are 4 to 6 inches tall, gradually fill in around them until the top of the trench is reached. By this method the roots are assured a plentiful supply of food in the driest spells.

The vines may be supported with brush, strings, wire or any handy form of trellis that will allow free circulation of air. Of course, good Sweet Peas can be grown without trenching, but extra attention is always well repaid with larger flowers, more of them, and a longer blooming season. Keep the flowers picked and the vines will bear longer.

We offer the best of the Spencer or Orchid-flowered Sweet Peas, these being far superior to the older Grandiflora type.

Summer-flowering Spencer Sweet Peas

We offer, this year, a completely revised list of this ever-popular flower. All the newer really worth-while varieties are included and a few of the old standbys that have defied improvement. Flowers are of huge size, gracefully waved, and are generally borne four to a stem.

New Mammoth
Dahlia-Flowered
Zinnia.

Zinnias AH

Zinnias are a great specialty with us and we take particular care to see that our stocks are the finest to be had. Our strains are grown especially for us by the originator of the famous Dahlia Flowered type. That our care has not been in vain is proven by the hundreds of complimentary reports we received on our Zinnias during the past Summer and Fall.

Zinnias are justly the most popular flower of today. They are easy to grow, require no staking and for brilliant color effect cannot be equalled. Zinnias require only a sunny spot in ordinary soil and an occasional weeding to reward you with an abundance of bloom from midsummer until late Fall.

Wild Garden Mixture

We have had so many calls for something in flowers that could just be scattered and raked in odd spaces to give a wild-flower-garden effect that we have made up a tall and dwarf mixture especially for this purpose. These mixtures contain a large assortment of the various annual flowers that will grow and bloom with little or no care.

If possible, the ground should be spaded, the seed scattered and raked in; good results are, however, obtained by scratching the soil as deeply as possible with a steel rake and then scattering the seeds.

HELPFUL HINTS FOR GARDENERS

Heavy Soils can be made lighter by working in Granulated Peat Moss or Humus.

Sandy or Light Soils will hold moisture better if Granulated Peat Moss or Humus is added.

Sour Soils need lime, but be sure the crop you are going to grow does best in sweet or sour soils and lime accordingly.

Ground Cover, Winter. Garden Kale, sown in early September, makes a most attractive ground cover for flower beds and may be turned under in the Spring to add humus to the soil.

Early and Late refers to the time it takes for the crop to mature from time of sowing seed. Early varieties may be used to advantage to plant in late Summer to get a crop before frost.

Summer Lettuce. Crisp-head and Cos Lettuce are best for Summer use.

Gladiolus flowers should not be cut too close to the ground, leave enough foliage to supply nourishment to the new bulb.

Gladiolus flowers should be cut as the first flower is opening, and they will last longer in water.

Snails and Beetles will seek shelter under small boards scattered through the garden. Lift the boards daily and destroy the accumulated insects.

Moles, according to old gardeners, will not go near castor oil beans; plant a few and be rid of these pests.

Cucumbers will be almost free of beetles if a few radishes are planted in each hill.

Don't Cover Seed Too Deeply.

Eating Insects are controlled by poison on the surface of the foliage.

Sucking Insects (aphis) must be wet with the spray (Black Leaf 40; Aphine; Agripax) to be effectively controlled.

Transplanting should be done as soon as possible after lifting the plants.

Make a Plan of your garden before planting.

Label everything for ready reference.

Thin Out and give all plants plenty of room in which to develop.

Nitrate of Soda is fine for all leaf crops, but do not use very much on fruit, flower or root crops.

Herbs are easy to grow and make a most interesting as well as useful addition to your garden.

Smooth Peas may be planted as soon as the ground can be made ready.

Wrinkled Peas should not be planted until the weather has become settled.

Sprays and Sprayers are necessities and must be kept in readiness for insect attacks.

White Clover, if sown very thickly, will help to eradicate weeds and crab grass.

Hard-Shelled Seeds should be soaked in warm water before sowing.

Weeds are more easily controlled when small.

Cultivate or Hoe frequently to conserve moisture.

Water Only when absolutely necessary, and then soak, don't sprinkle.

Late Plantings should be sown slightly deeper than early Spring plantings.

Novelties in both vegetables and flowers should be given a trial.

Dormant Spraying will not only control blights and diseases, but will kill the eggs of many insects.

Fall Sowing of many flower seeds is becoming popular, and is a very satisfactory method of getting early blooms.

Winter Vegetables. Beets, Carrots, Turnips and Squash may be kept in a cool cellar practically all Winter.

Pruning with care will increase the yield of both fruits and flowers.

Bird Houses will attract our feathered friends, who will pay rent by eating insects.

Order Early and avoid the late Spring rush.

Hotbeds and Cold Frames will prolong your garden operations two to three months.

Sweet Peas should be sown as early in the Spring as possible.

Tulips, Hyacinths and Narcissi; leaves should be brown before they are cut off.

Lawns will be benefited by an application of Bone Meal in early Spring, and Sulphate of Ammonia twice during the Summer.

Harden Off all plants grown in hotbed frames or in the house, by exposing to the air for a few hours a day, before transplanting to the garden.

Hardy Annual Flower Seeds may be sown as early in the Spring as the ground can be worked.

Ornamental Grasses are fine for making up mixed bouquets; grow a few.

Delphinium flower spikes should be cut as soon as they are faded, and a second crop of flowers will be borne in the Fall.

New Zealand Spinach, unlike other Spinaches, thrives in the hottest weather.

Everlasting Flowers are not only beautiful in the garden, but very pretty bouquets, that will last all Winter, may be made from them.

Rhubarb requires a very rich soil; cut off the seed stalks as fast as they make their appearance.

Chinese Cabbage grows best when started in late July or early August.

Sulphate of Ammonia is the best Summer fertilizer for lawns.

Perennial Flower Seeds may be planted outdoors any time from May 1st to September 10th.

For a Brilliant Display—Use Cannas.

Brilliant Cannas

Due to great improvements made in recent years, Cannas have become very popular for large beds and mixed borders. The foliage is quite ornamental and the blooms make a mass of color from July until frost.

Start the roots indoors in pots in early March and plant in their permanent position about the middle of May; or the roots may be planted in the place where they are to bloom in early May. Set plants $1\frac{1}{2}$ to 2 feet apart in a sunny location. The heights as stated will vary according to richness of the soil and location.

Dig roots after the first killing frost, cut off the foliage, and store in a cool, dry place over Winter.

Exhibition Dahlias

Bashful Giant.

The present great popularity of Dahlias is well deserved. They have a beauty and variety of form and color unequaled by any other flower and are adaptable to practically all garden schemes from a single plant in a small garden to veritable hedges in the more expansive gardens. Even beginners have wonderful results, while the more experienced gardeners are amply repaid by the additional size and beauty of blooms resulting from their expert care and attention. Dahlias are easy to grow in almost any soil, the two main requirements being plenty of sunlight and water.

PREPARING THE GROUND. Dahlias delight in a light, friable, loamy soil, enriched with well-rotted stable manure. Spade the ground full depth of the top soil and be sure that manure is thoroughly mixed with soil.

PLANTING. Tubers may be started indoors in boxes in April for later transplanting or planted outdoors from about the middle of May to the end of June. Lay the tubers flat, about 6 inches deep and 2 to 3 feet apart in the row.

GROWING. Do not permit more than two or three shoots to grow from a root, and when shoots are 2 feet high, pinch out the centers to promote branching growth.

FOR EXHIBITION. Permit only a single stem to grow from a root and cut off about half the lateral branches. Treated in this manner the plant will not only give larger flowers but they will all have full centers.

CURING AND STORING. When the foliage has been killed by Fall frosts, dig the roots, shake off as much soil as possible, and cut off all but 2 to 3 inches of the stems. Store the roots in a cool, dry place, stems down. It is not necessary to cover them with soil or ashes. We offer only standard divisions of dormant tubers.

FROM SEED. Dahlias are as easy to raise from seed as cabbage or tomatoes, and many interesting and profitable varieties may be produced. We offer seed of the choicest varieties on page 42.

Our Exhibition Dahlias include the best of the newer varieties. Each has been selected for real merit in comparison with a large number of other recent introductions. Con-

sidering size of blooms, coloring and robust growth, they all belong at the top of their classes. We supply good strong divisions of dormant tubers.

B. S. & B. Co.'s Supreme Gladiolus

Loveliest of Summer-blooming bulbous flowers for cutting, and also very effective when used in mixed borders and among shrubbery. Gladiolus are very easy to grow, and, while fertile soil will give best results, they will thrive and bloom in practically any garden soil, if planted in a sunny location.

Plant any time from mid-April to the end of June; in fact, we advise that planting be extended over this entire period, so that a succession of bloom may be had from July until frost. Plant bulbs 4 to 5 inches deep, 6 to 8 inches apart. Cultivate frequently, but not too deeply, during the growing season, and stake when 12 inches high.

Before the ground freezes in the Fall, dig the bulbs and let them dry in the sun for several days. When the tops are dry, cut them off about $\frac{1}{2}$ inch from the bulb and remove the old bulb from the bottom and discard. Store in a cool dry place where the temperature does not go below freezing.

DRICONURE

Dehydrated Cow Manure and
PEAT MOSS
Soil Improver

The Ideal Top Dressing and Soil Conditioner.

The ingredients are just manure from high protein fed cows and quality peat moss functioning as a humus making material and a reservoir for soil moisture. The composition is about thirty-five parts of peat moss and sixty-five parts cow feces—no straw, shavings or trash. It analyzes almost equivalent to a 2-1-2 fertilizer, embodying the desirable properties of humus.

Driconure is packed in waterproof bags, contents 3 bushels, average weight 50 lbs. Price per bag, \$3.00, delivered in Pittsburgh.

IMPORTED PEAT MOSS

Nothing that we have used will loosen the heavy clay soils found in the vicinity of Pittsburgh as well as this Imported Peat Moss.

Peat Moss consists mostly of partly decayed Sphagnum moss. The best grade of Peat Moss comes from Germany and is light, fibrous and porous, and light brown in color as compared to Peat from Ireland or this country, which is almost black, heavy and more like muck soil.

Peat Moss is valued for its ability to break up and make clayey soils more porous and to act as a binder for light, sandy soils.

FOR LAWNS

Apply Peat to established lawns early in the Spring about $\frac{1}{2}$ inch deep.

In making new lawns apply from 2 to 3 inches of Peat Moss and work into the soil. If desirable to use a fertilizer, use a high analysis fertilizer. Nitrophoska or Vigoro is excellent for this purpose. Mix the fertilizer and Peat Moss thoroughly before applying.

FLOWER AND VEGETABLE GARDENS

Use Peat Moss liberally on flower and vegetable gardens in the Spring, turning it under. Mulch the plants with Peat Moss, as soon as they are well up. Mulch Roses, Bush Fruits, Vines, Shrubs and Hedges. Fruit and Ornamental Trees. This conserves moisture and discourages weed growth.

GREENHOUSES AND FRAMES

Use Peat Moss in potting soil and seed beds. It keeps the soil moist, prevents crusting, giving the seedlings a quick, vigorous start. Cuttings root strongly in Peat Moss and there is little loss in transplanting, as the Peat Moss adheres to and supplies needed moisture to the fibrous roots.

STORING DAHLIAS AND BULBS

Dahlias and other tubers may be safely stored over Winter in Peat Moss. Place a layer of Peat Moss in the bottom of a box, basket or barrel. On this place a layer of tubers. Spread Peat Moss between and over the tubers. Then add another layer, continuing until the container is full, having a thick layer of Peat Moss over the top.

Clover Seeds

Red Clover.

Highest Grade Clovers

All of the Clover Seed offered below is of the highest quality as to purity and germination. They are all adapted for this section and fully comply with Federal and State Seed Laws.

Alfalfa. Purest Northwestern grown seed only. The most valuable hay crop and soil enricher. Requires well drained, limestone soil and should be inoculated with Stimugerm. Sow in Spring or late Summer, 20 lbs. per acre.

Alsike. Excellent hay Clover, thriving on poorly drained and slightly acid soils. Sow in early Spring, 6 to 8 lbs. per acre.

Crimson. A quick growing annual Clover, used on light soils as a green manure. Sow 12 to 15 lbs., per acre.

Medium Red. The old standby and one of the most valuable for hay, pasture, and green manure. Thrives best on well drained, sweet soil. Sow 10 to 15 lbs. per acre.

Mammoth Red. Grows larger, yields heavier, and is a little hardier, particularly on damp soils, than the common Medium Red. Matures with Timothy. Sow 10 to 15 lbs. per acre.

Hubam or Annual White Sweet. A strain of White Sweet Clover that produces a large yield of good hay in one season. Excellent for bees and a good soil enricher.

White Sweet Clover. Biennial; makes good hay and forage; thrives on poorer soil than any other Clover and is considered the greatest of all soil enrichers. For hay, sow 12 to 15 lbs., per acre.

White Dutch Clover. Our grass seed mixtures do not contain White Dutch Clover, as it does not mix well with grass seeds, which are lighter in weight. However, White Dutch Clover has a definite place in lawns, as it produces a quick sod and helps to feed the other grasses. Unless a very heavy seeding is required, as for poor soils, 1 lb. per 2000 square feet is sufficient.

STIMUGERM LEGUME INOCULATION

Soil and crop experts agree that Stimugerm not only increases crop production but also greatly improves the soil. It should be used on the seed of all legumes, like clover, peas, and beans.

Be sure to state kind of seed on which Stimugerm is to be used.

Hay and Pasture Mixtures

We can highly recommend the following mixtures of grasses and clovers for hay and pasture. When ordering state nature of soil on which these mixtures are to be used.

Permanent Hay Mixture. A special mixture of grasses and clovers that will produce heavy yields of hay and is very permanent. Also useful for planting in orchards. Sow 50 lbs. per acre. 10 lbs., \$3.25; 100 lbs., \$27.50.

Permanent Pasture Mixture. A special mixture of long lived grasses and clovers that will produce fine pasturage from early Spring until late Fall. Also used for meadows. 10 lbs., \$3.25; 100 lbs., \$27.50.

Green Manures

Green Manure is the term applied to any crop grown for the purpose of plowing under. Green Manures are valuable in two ways. First, the growing crop utilizes, stores up, and when plowed under returns to the soil valuable fertilizing materials that would otherwise be leached away by the rains. Second, certain plants (clovers, beans, peas, and vetches), have the faculty of extracting and storing up nitrogen from the air, and when turned under such crops add nitrogen to the soil in the best form for the use of succeeding crops.

For Green Manure the nitrogen gathering plants, as noted above, are the best to use, and of these cow peas, Canada field peas and soy beans are most generally used, although any of the clovers are good. Other crops used for green manure are buckwheat, rye and the millets.

Where possible two crops should be grown and turned under in one year, thus saving valuable time. For this purpose rye or vetch or both should be sown in the Fall and plowed under the following June, when cow peas, soy beans or buckwheat may be sown for turning under in the Fall.

ADCO MAKES MANURE

Adco when applied to a pile of vegetable matter makes excellent manure. See page 83.

NITROPHOSKA

15-30-15

Nitrophoska contains all of the three essential plantfoods—nitrogen, phosphoric acid and potash—concentrated in one material. It has 15 per cent of nitrogen, 30 per cent of phosphoric acid and 15 per cent of potash. Nitrophoska produces strong and vigorous growth of rich green color, able to bloom and bear to the utmost.

FLORANID

(UREA)

Floranid is a very rich nitrogen fertilizer (46% nitrogen), used principally during the growing season to obtain more rapid growth, richer color of foliage and greater brilliancy of bloom. The nitrogen in Floranid is in the same chemical form as in liquid manure. Twenty-two pounds of Floranid contains as much nitrogen as a ton of manure. One pound of Floranid is enough for one application to 1000 square feet of lawn or garden.

Garden, Lawn and Farm Fertilizers

WHY FERTILIZERS ARE NECESSARY

Plants are constantly drawing nitrogen, phosphorus, potash and other elements from the soil, and when your farm or garden produces a crop of vegetables, flowers, cereals or fruit, a certain portion of these important plant foods are removed from the soil.

Continued planting and removing of crops would soon exhaust the supply of these necessary plant foods, were it not that by the use of commercial fertilizers, stable and barnyard manure, we are able to replenish the supply and thereby keep up the fertility of the soil.

Stable and barnyard manures are now difficult to obtain and it is only by the use of commercial fertilizers and green manures that we are able to put back into the soil, the important elements that have been removed. Owing to the fact that some crops take more of one element from the soil than others, our fertilizers are made up of special formulas for the different crops.

The National Ant Control

Now a method has been discovered that is most effective in the control of Argentine and all honey-dew-loving species of ants. It is called Antrol—a syrup that is placed about your premises in tiny glass jars with special green tops. Ants eat it as a food and thus carry its mildly poisonous contents to the entire colony. These pots are made from Pure Peat Moss and are used the same as ordinary clay pots. Their advantage lies in the fact that they are very retentive of moisture and do not dry out as quickly as clay pots; also, instead of becoming pot bound, the roots can grow through the Peat Pot and plants can be planted pots and all.
